
BS 7799 Certification Services

The merger of computers and communication has facilitated on-line real time data accessibility for timely and effective decision-making. However, accessing, storing and transmitting data over continents has created its own problems of data security. An effective Information Security Management System provides the right framework for data security and information risk management. BS 7799 is one such Information Security Management System standard.

About the standard

BS 7799 is the standard for Information Security Management Systems, detailing how an organization should evaluate, manage and control risks associated with one of its most important assets – **information**.

The implementation of a formal Information Security Management System based on BS 7799 provides a framework for ensuring information security and risk management thereby leading to increased customer confidence and effective utilization of the allocated risk capital.

Issues addressed by KPMG's Certification Process for BS 7799 standard

- Proactive approach to an increasing dependence on the integrity and confidentiality of information to satisfy business and customer needs
- Identification, management and reduction of risk associated with business and customer information
- Integrity and confidentiality of information and data
- Legislative and regulatory compliance.

Benefits of the Audit and Certification Process for BS 7799 standard

- Identification and validation of risks associated with information security
- Better risk management with respect to information assets and therefore better allocation of risk capital
- Improved business continuity management
- Increased employee awareness leading to effective implementation.
